## Heterogeneous I mine Metathesis Facilitated by Surface Organ metallic Fragments (SOMF) for Group 4imido Complexes

## Maha A. Aljuhani<sup>1\*</sup>, Samir Barman, Edy Abou-Hamad, Jeremie D. A. Pelletier and Jean-Marie Basset

KAUST Catalysis Center, Division of Physical Sciences and Engineering, King Abdullah University of Science and Technology (KAUST), Kingdom of Saudi Arabia

Well-defined single-site surface species  $[(\equiv Si-O-) Hf(NMe_2)_3]$  generates  $[(\equiv Si-O-Hf([=NMe)NMe_2]]$  that displays a methylimido fragment after 24 hr heating under high vacuum (10-5 mbar). Both surface species were characterized by FT-IR spectroscopy, elemental analysis, <sup>1</sup>H-<sup>13</sup>C HETCOR and DNP. Treatment by minute amount  $[(\equiv Si-O-Hf([=NMe)NMe_2]]$  of two different imine substrates (imine metatheis) led to rapid imine exchange compared to its Ti and Zr peers catalyst.

## **Biography:**

Maha A Aljuhani A Ph. D student at KAUST. Research interests are in Synthesis of nanomayetrals, and catalysis.
