

Evolution by Tumor Neofunctionalization and Phenomenon of Tumor Specifically Expressed, Evolutionarily Novel (*TSEEN*) genes

A.P.Kozlov

Biomedical Center and Peter the Great St.Petersburg Polytechnic University, Russia

Earlier I formulated the hypothesis of the possible evolutionary role of tumors. This hypothesis suggests that tumors supply evolving multicellular organisms with extra cell masses for the expression of newly evolving genes. After expression of novel genes in tumor cells, tumors differentiate in new directions and give rise to new cell types, tissues and organs.

In the presentation, the bulk of data supporting the positive evolutionary role of tumors will be reviewed, obtained both in the lab of the author and from the literature sources.

The following issues will be addressed: the widespread occurrence of tumors in multicellular organisms; features of tumors that could be used in evolution; the relationship of tumors to evo-devo; examples of recapitulation of some tumor features in recently evolved organs; the types of tumors that might play the role in evolution; examples of tumors that have played the role in evolution.

The discussion of experimental confirmation of nontrivial predictions of the hypothesis will include the analysis of evolutionary novelty of tumor-specifically expressed EST sequences; *ELFNI – ASI*, a human gene with possible microRNA function expressed predominantly in tumors and originated in primates; *PBOVI*, a human gene of the recent *de novo* origin with predicted highly tumor-specific expression profile; the evolutionary novelty of human cancer/testis antigen genes; etc.

The conclusion is made that expression of protogenes, evolutionarily young and/or novel genes in tumors might be a new biological phenomenon, a phenomenon of TSEEN (**T**umor **S**pecifically **E**xpressed, **E**volutionarily **N**ew) genes, predicted by the hypothesis of evolution by tumor neofunctionalization.

Biography:

Andrei P. Kozlov, Ph.D., Dr.Sci., Professor of Molecular Biology, was born in Leningrad in 1950. In 1972 he graduated with honors from St. Petersburg State University (Department of Biochemistry). During the period 1972-1975, he completed postgraduate studies at the N.N. Petrov Research Institute of Oncology and successfully defended his Ph.D. thesis devoted to the studies of low molecular weight nuclear RNAs in normal and tumor tissues. In 1978-1979 Dr. Kozlov served in a tenured Research Training Fellowship awarded by the International Agency for Research on Cancer at the laboratory of Robert Gallo at the National Cancer Institute.
