

New Approach for Eye Tightening

Belkais Marwan

Dermapremier Skin Clinic, Egypt

As we age, our bodies produce less Collagen and Elastin. This causes our skin to lose elasticity and firmness, resulting in sagging skin. The skin around your eyes is thin and more sensitive than the skin elsewhere on our body. It's more prone to wrinkles, sagging and fine lines.

In the past, they considered the upper lid Blepharoplasty to be in the domain of a surgeon after all, and that we can only slightly help in lifting the eyelids with Botox. Plasma based energy device (Purisma) developed to treat this delicate area safely and perfectly where lasers and radio surgical units cannot. During the treatment itself, the skin of the upper and lower lids is lifted and the excess skin disappears without surgery and without long recovery time.

It works according to the principle of fractional plasma and is extremely precise and creating a series of minute dots on the skin, which trigger an instant contraction, and tightening of the skin, to create a lifting, remodeling and rejuvenating effect of the treated area.

Biography:

Dr. Belkais Marwan graduated from Al Minia University in 1994 (Egypt), she obtained her Masters Degree in Dermatology in 1999.
